Outcomes/Assessment

Objectives/Evaluation

Rationale: Preparing for Canvas

Proposed Start Semester: Spring/Summer 2024

Course Description: In this course, students learn to administer Microsoft Server in a small-to-medium business environment. Topics covered include managing server roles, Internet Protocol (IP) addressing or Dynamic Host Configuration Protocol (DHCP), Domain Name System (DNS), Active Directory, Group Policy, Storage Management, and Virtualization. An intermediate understanding of Windows operating systems and networking principles is required. The title of this course was previously Installation, Storage, and Compute - Windows Server.

Course Credit Hours

Variable hours: No

Credits: 4

Lecture Hours: Instructor: 60 Student: 60

Lab: Instructor: 0 Student: 0

Clinical: Instructor: 0 Student: 0

Proposed For:

Eastern Michigan University

Student Learning Outcomes

1. Configure On-Premises Windows Server Active Directory environment consistent with the needs of a small to medium sized organization.

Assessment 1

Assessment Tool: Outcome-related interactive and written test questions

Assessment Date: Fall 2025

Assessment Cycle: Every Three Years

Course section(s)/other population: All sections

Number students to be assessed: All students

How the assessment will be scored: Answer key

Standard of success to be used for this assessment: 70% of the students will correctly answer 80% of the outcome-related questions.

Who will score and analyze the data: Departmental faculty

2. Implement security policies for organization structure with file and folder access restrictions, user policies, system policies, and audit policies.

Assessment 1

Assessment Tool: Outcome-related interactive and written test questions

Assessment Date: Fall 2025

Assessment Cycle: Every Three Years

Course section(s)/other population: All sections

Number students to be assessed: All students

How the assessment will be scored: Answer key

Standard of success to be used for this assessment: 70% of the students will correctly answer 80% of the outcome-related questions.

Who will score and analyze the data: Departmental faculty

3. Troubleshoot various configuration problems in a Microsoft Server network.

Assessment 1

Assessment Tool: Outcome-related interactive and written test questions

Assessment Date: Fall 2025

Assessment Cycle: Every Three Years

Course section(s)/other population: All sections

Number students to be assessed: All students

How the assessment will be scored: Answer key

Standard of success to be used for this assessment: 70% of the students will correctly answer 80% of the outcome-related questions.

Who will score and analyze the data: Departmental faculty

Course Objectives

1. Install various Windows Server operating systems.
2. Configure multiple server roles and features.
3. Identify IP addressing, numbering systems, and protocols.
4. Configure DHCP and DHCP Relay.
5. Configure network teaming.
6. Configure DNS.
7. Configure Active Directory.
8. Manage Active Directory objects.
9. Manage Active Directory Group Policy.
10. Configure disk, volume, storage spaces, and replica.
11. Configure disk quota, Branch Cache, Distributed File System (DFS, and Server Message Block (SMB) shares.
12. Configure virtual machines for storage, replication, and high availability.

 Objectives/Evaluation

Rationale: Remove 2016 from course name and description due to upgrade in software.

Proposed Start Semester: Winter 2022

Course Description: This course is part of a series of courses that provides the skills and knowledge necessary to work in a Windows Server environment and lays a foundation for the first Windows Server MCSA certification. Students will learn topics such as the installation options for Server including graphical, server core, Nano server, and server containers. Also, methods of handling installations, including imaging and various image deployment options are covered. Storage features such as RAID, storage spaces, iSCSI, and fail-over clustering are implemented with both physical and virtual disks. Server maintenance including backups, WSUS, VM migration and replicas, network load balancing and permissions are incorporated. The title of this course was previously Installation, Storage, and Compute - Windows Server 2016.

Proposed For:

Eastern Michigan University

Student Learning Outcomes

1. Identify the Windows Server editions, the types of installations, including the techniques for configuring the graphical version, Server Core, Nano Server, and Window Server Containers using virtualization techniques within Hyper-V, performing installations over the network and performing subsequent post-installation tasks using the command line and PowerShell.

Assessment 1

Assessment Tool: Outcome-related written exam questions
Assessment Date: Fall 2022
Assessment Cycle: Every Three Years
Course section(s)/other population: All sections
Number students to be assessed: All students
How the assessment will be scored: Departmentally-developed rubric
Standard of success to be used for this assessment: 70% of the students will score 70% or higher on the outcome-related questions.
Who will score and analyze the data: Departmental faculty

2. Identify the principles related to installing various storage solutions including implementing various forms of RAID, (0,1,3), storage spaces with thin provisioning, and iSCSI fault tolerant storage with simultaneous access from multiple servers.

Assessment 1

Assessment Tool: Outcome-related written exam questions
Assessment Date: Fall 2022
Assessment Cycle: Every Three Years
Course section(s)/other population: All sections
Number students to be assessed: All students
How the assessment will be scored: Departmentally-developed rubric
Standard of success to be used for this assessment: 70% of the students will score 70% or higher on the outcome-related questions.
Who will score and analyze the data: Departmental faculty

3. Recognize and identify the various implementations of server and client image preparation and deployment, including the use of the DISM and SysPrep Tools, plus implementing Windows Deployment Services in an Active Directory environment.

Assessment 1

Assessment Tool: Outcome-related written exam questions
Assessment Date: Fall 2022
Assessment Cycle: Every Three Years
Course section(s)/other population: All sections
Number students to be assessed: All students

How the assessment will be scored: Departmentally-developed rubric

Standard of success to be used for this assessment: 70% of the students will score 70% or higher on the outcome-related questions.

Who will score and analyze the data: Departmental faculty

4. Recognize and identify fault tolerant and load balancing solutions, including fail-over clustering with a separate iSCSI network, Network Load Balancing using web servers, and Hyper-V Migration and Replicas transferring live virtual machines between hosts.

Assessment 1

Assessment Tool: Outcome-related written exam questions

Assessment Date: Fall 2022

How the assessment will be scored: Departmentally-developed rubric

Standard of success to be used for this assessment: 70% of the students will score 70% or higher on the outcome-related questions.

Who will score and analyze the data: Departmental faculty

5. Identify and configure maintenance and security implementations including Windows backup, Windows Server Update Services (WSUS), data deduplication, and permissions including NTFS Security as well as share permissions.

Assessment 1

Assessment Tool: Outcome-related written exam questions

Assessment Date: Fall 2022

Assessment Cycle: Every Three Years

Course section(s)/other population: All sections

Number students to be assessed: All students

How the assessment will be scored: Departmentally-developed rubric

Standard of success to be used for this assessment: 70% of the students will score 70% or higher on the outcome-related questions.

Who will score and analyze the data: Departmental faculty

Course Objectives

1. Identify the various methods of Windows Server installations including stand-alone, over the network, etc., and the initial configuration of a Server installation including naming, addressing, and other important settings.
2. Identify server virtualization techniques including installation of various editions (Server Core and Nano Server) of Windows Server and Windows 10 in a virtual machine, and identify the tools necessary for management of these operating systems remotely and with PowerShell.
3. Identify the various editions of Windows Server, including their suggested uses, their price structure, types of licenses/activation techniques and the various options and components associated with each one.
4. Define the methods for creating Windows Operating System (OS) Containers, including the Server Core OS and the Web Server OS using the Docker tools, and the methods for the configuration and testing of these systems.
5. Identify the components associated with virtual networking, including the three main types of virtual networks, the creation of multiple virtual networks of each type, virtual switch components including MAC and IP addressing, and V-LANs.
6. Identify the different forms of basic RAID used with Windows Server, including Raid 0 - striping, Raid 1 - mirroring, Raid 5 - striping with parity, and testing each form using actual disk failures.
7. Create and configure thin provisioning with Windows Server storage space implementations including creating large virtual disks made up of a number of small physical disks, testing of fault-tolerance, hot swapping of disks and disk recovery.

8. Identify the methods for creating an iSCSI storage solution on a separate high speed network, using a Virtual Server iSCSI target, and two physical Windows Server iSCSI initiators and implement a solution for multiple simultaneous access to the target.
9. Differentiate various methods of disk configurations, including converting VHDX to VHD virtual disks and vice-versa, mounting virtual disks as physical disks to make changes in them, and booting natively, virtual operating systems from virtual disks.
10. Identify the steps in preparing Windows 10 and Windows Server images including using the Command Line for combining partitions, and running the SysPrep tool for setting operating system uniqueness for an "out of the box" experience.
11. Distinguish the various steps in capturing and deploying images with the DISM (Deployment Image Servicing and Management) Tool, including using remote network locations, external media, and options for verification.
12. Distinguish the tools used for unattended installations including preparing an XML answer file with the WSIM (Windows System Image Manager) tool and the networking tools, WOL (Wake-on-Lan) and PXE (Preexecution Environment).
13. Identify how modularization is used for creating the various versions of Windows Server from a single image file using a base image and adding modules to it for the various versions.
14. Define the various components of using Windows Deployment Services for automatic unattended deployment of operating systems including the use of Active Directory, a DNS and DHCP Server, a Windows Deployment Server, and a Network card supporting WOL and PXE.
15. Demonstrate using fail-over clustering with a separate internal network having an iSCSi Target including the incorporation of two servers with testing performed to insure proper switch over.
16. Recognize and identify the various forms of Virtual Server Migration and where each would be used, including live migration from one physical host to another, quick migration, and storage migration.
17. Recognize and identify the forms of Virtual Server Replication from one physical host to another for fault tolerance, including the three different types - planned failover, unplanned failover, and test failover.
18. Distinguish the various steps in creation and configuration of the Windows Server Network Load Balancing feature with two separate physically identical web servers including using the NLB Tool for convergence and a client workstation for testing.
19. Define and differentiate Windows Server security permissions including local NTFS security permissions, network share permissions, and the interaction between the two plus identify file and folder ownership characteristics.
20. Identify the various uses for Windows Server Backup tool, including doing data, system component, and complete operating system backups and restores to/from internal, external, and network-based storage devices.
21. Identify the steps required to implement the Windows Server Update Services (WSUS) utility including the use of upstream and downstream servers, configuration of appropriate group policy settings, and actual methods of testing with Windows Client machines.
22. Identify the uses of the data deduplication tool to eliminate redundant data throughout disk storage structures to save disk space, including the appropriate testing to measure the effect of its implementation as well as determining the actual location of the sole data copy.

Outcomes/Assessment

Objectives/Evaluation

Rationale: The three Microsoft MCSA Certifications have totally changed for the 2016 version of Windows Server. The emphasis with this first certification (which CNT211 aligns to) is now Installation, Storage and Maintenance in contrast to the Windows Server 2012 version which covered topics that have now been moved to the other two certifications. Also, a considerable number of new features have been added, resulting in additional material to incorporate into this version of the course.

Proposed Start Semester: Spring/Summer 2018

Course Description: This course is part of a series of courses that provides the skills and knowledge necessary to work in a Windows Server 2016 environment and lays a foundation for the first Windows Server 2016 MCSA certification. Assessment 1

Assessment Tool: Written exam specifically created for the assessment

Assessment Date: Fall 2020

Assessment Cycle: Every Three Years

Course section(s)/other population: All course sections

Number students to be assessed: All students

How the assessment will be scored: Rubric: A written test will be given that addresses both the outcomes and objectives listed in the syllabus. This test will be divided into sections, each identified with an outcome, and the questions in each section will address the objectives.

Standard of success to be used for this assessment: Average of all students taking the test should equal or exceed 70% correct answers for all questions used in the assessment test. 70% or greater of the number of students taking the assessment test should equal or exceed that 70% mark for all the questions used in the assessment test. Outcome success: average of all student scores for each particular outcome's part of the test equals or exceeds 70%.

Who will score and analyze the data: All departmental instructors who teach sections of this course

2. Identify the principles related to installing various storage solutions including implementing various forms of RAID, (0,1,3), storage spaces with thin provisioning, and iSCSI fault tolerant storage with simultaneous access from multiple servers.

Course Objectives

1. Identify the various methods of Server 2016 installations including stand-alone, over the network, etc., and the initial configuration of a Server installation including naming, addressing, and other important settings.
2. Identify server virtualization techniques including installation of various editions (Server Core and Nano Server) of Server 2016 and Windows 10 in a virtual machine, and identify the tools necessary for management of these operating systems remotely and with PowerShell.
3. Identify the various editions of Server 2016, including their suggested uses, their price structure, types of licenses/activation techniques and the various options and components associated with each one.
4. Define the methods for creating Windows Operating System Containers, including the Server Core OS and the Web Server OS using the Docker tools, and the methods for the configuration and testing of these systems.
5. Identify the components associated with virtual networking, including the three main types of virtual networks, the creation of multiple virtual networks of each type, virtual switch components including MAC and IP addressing, and V-LANs.
6. Identify the different forms of basic RAID used with Windows Server 2016, including Raid 0 - stripping, Raid 1 - mirroring, Raid 5 - stripping with parity, and testing each form using actual disk failures.
7. Create and configure thin provisioning with Windows Server storage space implementations including creating large virtual disks made up of a number of small physical disks, testing of fault-tolerance, hot swapping of disks and disk recovery.
8. Identify the methods for creating an iSCSI storage solution on a separate high speed network, using a Virtual Server 2016 iSCSI target, and two physical Server 2016 iSCSI initiators and implement a solution for multiple simultaneous access to the target.
9. Differentiate various methods of disk configurations, including converting VHDX to VHD virtual disks and vice-versa, mounting virtual disks as physical disks to make changes in them, and booting natively, virtual operating systems from virtual disks.
10. Identify the steps in preparing Windows 10 and Server 2016 images including using the Command Line for combining partitions, and running the SysPrep tool for setting operating system uniqueness for an "out of the box" experience.
11. Distinguish the various steps in capturing and deploying images with the DISM (Deployment Image Servicing and Management) Tool, including using remote network locations, external media, and

- options for verification.
12. Distinguish the tools used for unattended installations including preparing an XML answer file with the WSIM (Windows System Image Manager) tool and the networking tools, WOL (Wake-on-Lan) and PXE (Preexecution Environment).
 13. Identify how modularization is used for creating the various versions of Windows Server 2016 from a single image file using a base image and adding modules to it for the various versions.
 14. Define the various components of using Windows Deployment Services for automatic unattended deployment of operating systems including the use of Active Directory, a DNS and DHCP Server, a Windows Deployment Server, and a Network card supporting WOL and PXE.
 15. Demonstrate using fail-over clustering with a separate internal network having an iSCSi Target including the incorporation of two servers with testing performed to insure proper switch over.
 16. Recognize and identify the various forms of Virtual Server Migration and where each would be used, including live migration from one physical host to another, quick migration, and storage migration.
 17. Recognize and identify the forms of Virtual Server Replication from one physical host to another for fault tolerance, including the three different types - planned failover, unplanned failover, and test failover.
 18. Distinguish the various steps in creation and configuration of the Server 2016 Network Load Balancing feature with two separate physically identical web servers including using the NLB Tool for convergence and a client workstation for testing.
 19. Define and differentiate Windows Server 2016 security permissions including local NTFS security permissions, network share permissions, and the interaction between the two plus identify file and folder ownership characteristics.
 20. Identify the various uses for Windows Server 2016 Backup tool, including doing data, system component, and complete operating system backups and restores to/from internal, external, and network-based storage devices.
 21. Identify the steps required to implement the Windows Server Update Services (WSUS) utility including the use of upstream and downstream servers, configuration of appropriate group policy settings, and actual methods of testing with Windows Client machines.
 22. Identify the uses of the data deduplication tool to eliminate redundant data throughout disk storage structures to save disk space, including the appropriate testing to measure the effect of its implementation as well as determining the actual location of the sole data copy.
